Marinx E., Davail S., Feller G., Gerday C.;

Nuclectide and derived amino acid sequence of the subtilisin from "nuclectide and derived amino acid sequence of the subtilisin from the antarctic psychrotroph Bacillus TA39.";

Biochim. Biophys. Acta 113:111-113(1952).

IL CATALYZES THE HYDROLYSIS OF PROTEINS AND PEPTIDE AMIDES.

IT CATALYTIC ACTIVITY: Hydrolysis of proteins with broad specificity for peptide bonds, and a preference for a large uncharged residue in Pl. Hydrolyzes peptide amides.

I SUBCELLULAR LOCATION. Secreted.

IN SCELLANBOUS: STILL ACTIVE AT TEMPERATURES CLOSE TO 0 DEGREES CELSIUS, IT HAS A MARKED HEAT LABILITY.

SUBCELLANBOUS: SECRETION OF SUBTILISIN IS ASSOCIATED WITH ONSET OF SPORULATION, AND MANY MUTATIONS WHICH BLOCK SPORULATION AT EARLY STAGES AFPECT EXPRESSION LEVELS OF SUBTILISIN. HOWEVER, SUBTILISIN IS NOT NECESSARK FOR NORMAL SPORULATION.

IS NOT NECESSARK FOR NORMAL SPORULATION.

IS NOT NECESSARK FOR NORMAL SPORULATION.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         MEDLINE-88151937; PubMed=3162211; Matsurawa H., Tokugawa K., Hamaoki M., Mizoguchi M., Taguchi H., Terada I., Kwon S.-T., Ohta T.; Furbification and characterization of aqualysin I (a thermophilic alkaline serine protease) produced by Thermus aquaticus YT-1."; Fur. J. Biochem. 171:441-447(1988).

'I FUNCTION: AQUALYSIN I IS A THERMOPHILIC ALKALINE SERINE PROTEASE. THE OPTIMAL TEMPERATURE FOR ITS CASEINOLYTIC ACTIVITY IS 80 DEGREES CELSIUS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              DEVELOPMENTAL STAGE: SECRETED FROM THE EARLY STATIONARY PHASE UNTIL THE TIME THE CELLS CEASE TO GROW.

PTM: THE N- AND C-TERMINAL PRO-SEQUENCES ARE REMOVED THROUGH THE PROTEOLYTIC ACTIVITY OF AQUALYSIN I ITSELF, IN THAT ORDER. THE C-TERMINAL PRO-SEQUENCE IS REQUIRED FOR TRANSLOCATION OF THE PROTEASES ACROSS THE OUTER MEMBRANE.

PTM: TWO DISULFIDE BONDS ARE PRESENT.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Terada I., Kwon S.-T., Miyata Y., Matsuzawa H., Ohta T., "Unique precursor structure of an extracellular protease, aqualysin I. with NH2- and COOH-terminal pro-sequences and its processing in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Kwon S.-T. ```
AND ONE WITH LOW APPINITY) WHICH SEEM TO PLAY AN IMPORTANT ROLE IN THE STABILIZATION OF THE TERTIARY STRUCTURE OF THE ENZYME.
SUBCELLULAR LOCATION. Secreted.
BIOTECHHOLOGY: Used as a detergent protease. Sold under the name Savinase by Novozymes.
MISCELLANBOUS: SECRETION OF SUBTILISIN IS ASSOCIATED WITH ONSET OF SPORULATION, AND MANY MUTATIONS WHICH BLOCK SPORULATION AT EARLY STRAGES AFFECT EXPRESSION LEVELS OF SUBTILISIN. HOWEVER, SUBTILISIN IS NOT NECESSARY FOR NORMAL SPORULATION.
SIMILARITY: BELONGS to peptidase family S8.
                                                                                                                                          Blochemistry 37:13446-13452(1998).

-!- FUNCTION: SUBTILISIN IS AN EXTRACELLULAR ALKALINE SERINE PROTEASE.

-!- FUNCTION: SUBTILISIN IS AN EXTRACELLULAR ALKALINE SERINE PROTEASE.

IT CATALYZES THE HYDROLYSIS OF PROTEINS AND PEPTIDE AMIDES.

-!- CATALYTIC ACTIVITY: Hydrolysis of proteins with broad specificity for peptide bonds, and a preference for a large uncharged residue in P1. Hydrolyzes peptide amides.

-!- ENZYME REGULATION: BINDS TWO CALCIUM IONS (ONE WITH HIGH AFFINITY
                            X-RAY CRYSTALLOGRAPHY (0.78 ANGSTROMS).

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

T. brucei sheared genomic DNA clone 319910, forward sequence, genomic survey sequence.
                                                                                                                                                                                                                                                                                                                                                                                                           Constructed at the Institute for Genomic Research (TIGR),
Rockville, MD. Genomic DNA isolated from a cloned population of
Trypanosoma brucei (TREU927/4 GUTAT 10.1) was mechanically sheared
to give a tight size distribution (
4 kb). The v + i method used for the library construction is
described in detail in Smith, H and Venter, J.C. (Making small
shown Sequencing: A Practical Approach, eds. M. Vaudin and B.
Barrell, Oxford University Press, 1999).
Details of T. brucei sequencing at the Sanger Centre are available
at http://www.sanger.ac.uk/Projects/T_brucei/.

/clone_lib="Sheared DNA"
/note="Wector: pUC18; Site_l: Smal; Constructed at The Institute for Genomic Research (FIGR), Rockville, MD. Genomic DNA isolated from a cloned population of Trypanosoma brucei (TREU927/4 GUTAL 10.1) was mechanically sheared to give a tight size distribution (approx 2 kb). The v + i method used for the library construction is described in detail in Smith, H.O. and Venter, J.C. (Making small insert libraries for whole genome shotgun sequencing projects. In Genome Sequencing: A Practical Approach, eds. M. Vaudin and B. Barell, Oxford University Press, 1999)."
                                                            Trypanosoma.

Determination of clone end sequences from Trypanosoma brucei GUTat 10.1 sheared DNA library
                                                                                                                                                                                                                                                                                                                                                                                                                                               Clones are derived from the Trypanosoma brucei GUTat 10.1 sheared DNA library constructed at TIGR. Clones will be available for distribution through ATCC. Sheared DNA end sequences search page: http://www.tigr.org/tdb/mdb/tbdb/.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          156 IleLeuPheAlaAlaGlyAsnGluGlyProAsnGlyGlyThrIleSerAlaProGlyThr 175

   Rockville, MD. Genomic DNA isolated from a cloned population of Trypanosoma brucei (TRED927/4 GUTat 10.1) was mechanically sheared to give a tight size distribution (
4 kb). The v + i method used for the library construction is described in detail in Smith, H. and Venter, J.C. (Making small insert libraries for whole genome shotgun sequencing projects. In Barrell, Oxford University Press, 1999).
